

Miscellaneous

This sector includes several measures that will reduce GHG emissions through the implementation of novel or offsite projects defined by the user. The general quantification framework for three measures is outlined in this section, although all require users to identify the expected GHG reductions that will be achieved by the measures. A fourth measure, M-6, *Off-Road Equipment Efficiency*, is a more defined measure and has an identical methodology as Measures C-1-A, *Use Electric or Hybrid Powered Equipment*, in the Construction sector and N-8, *Agricultural Equipment Efficiency*, in the Natural and Working Lands sector. Measure M-6 is included in this sector because it applies to other (i.e., miscellaneous) equipment that is not used for construction or agricultural purposes. Use the below graphic to click on an individual measure to navigate directly to the measure's factsheet. *Supporting or Non-Quantified GHG Reduction Measures* includes two additional measures in the miscellaneous sector that target environmentally responsible purchasing and funding for incentives.

Miscellaneous

- M-1. Establish a Carbon Sequestration Project
- M-2. Establish Offsite Mitigation
- M-3. Implement an Innovative Strategy for GHG Mitigation
- M-6. Off-Road Equipment Efficiency
